

## Parte 1

Encendemos Apache.

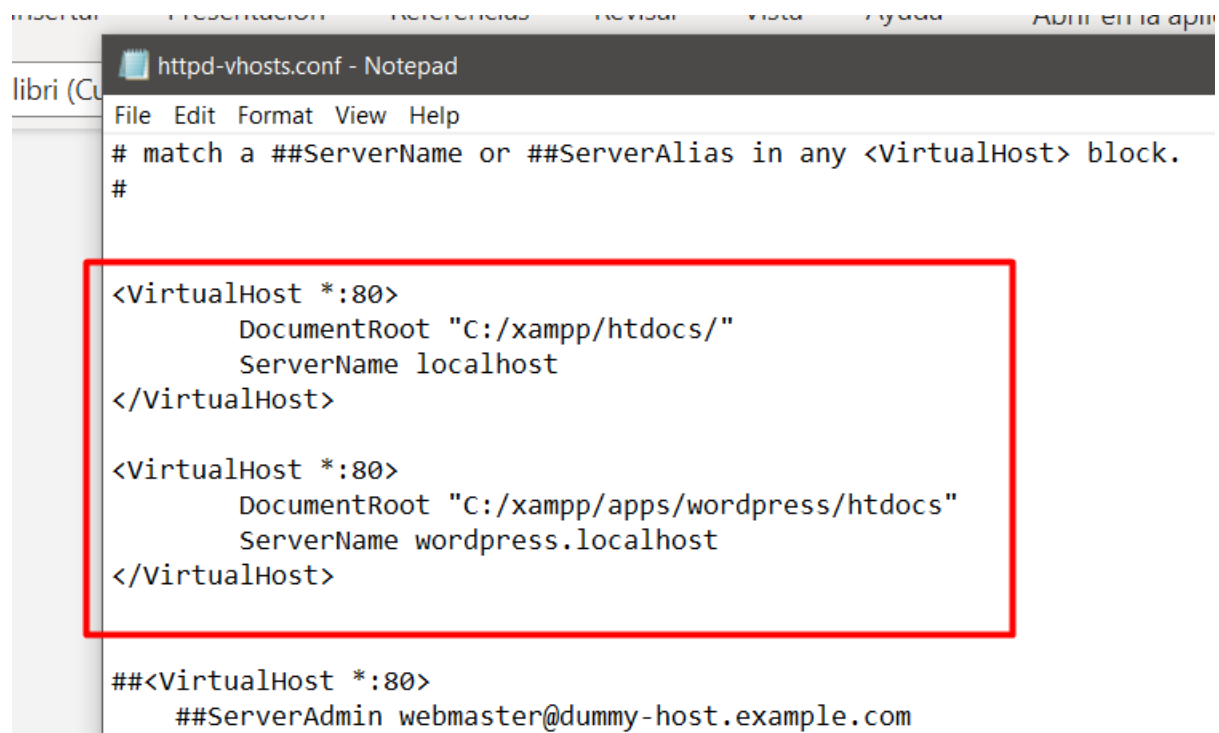

Creamos la carpeta app01 en la carpeta htdocs de xampp y dentro de ella un documento index.html.

Al cambiarle el nombre al documento index.html, por defecto muestra un índice del contenido de la carpeta con enlaces a los distintos contenidos.

Ahora vamos a cambiar la carpeta de configuración de apache llamada httpd-hosts.conf para incluir la configuración de los bloques de hosts virtuales.

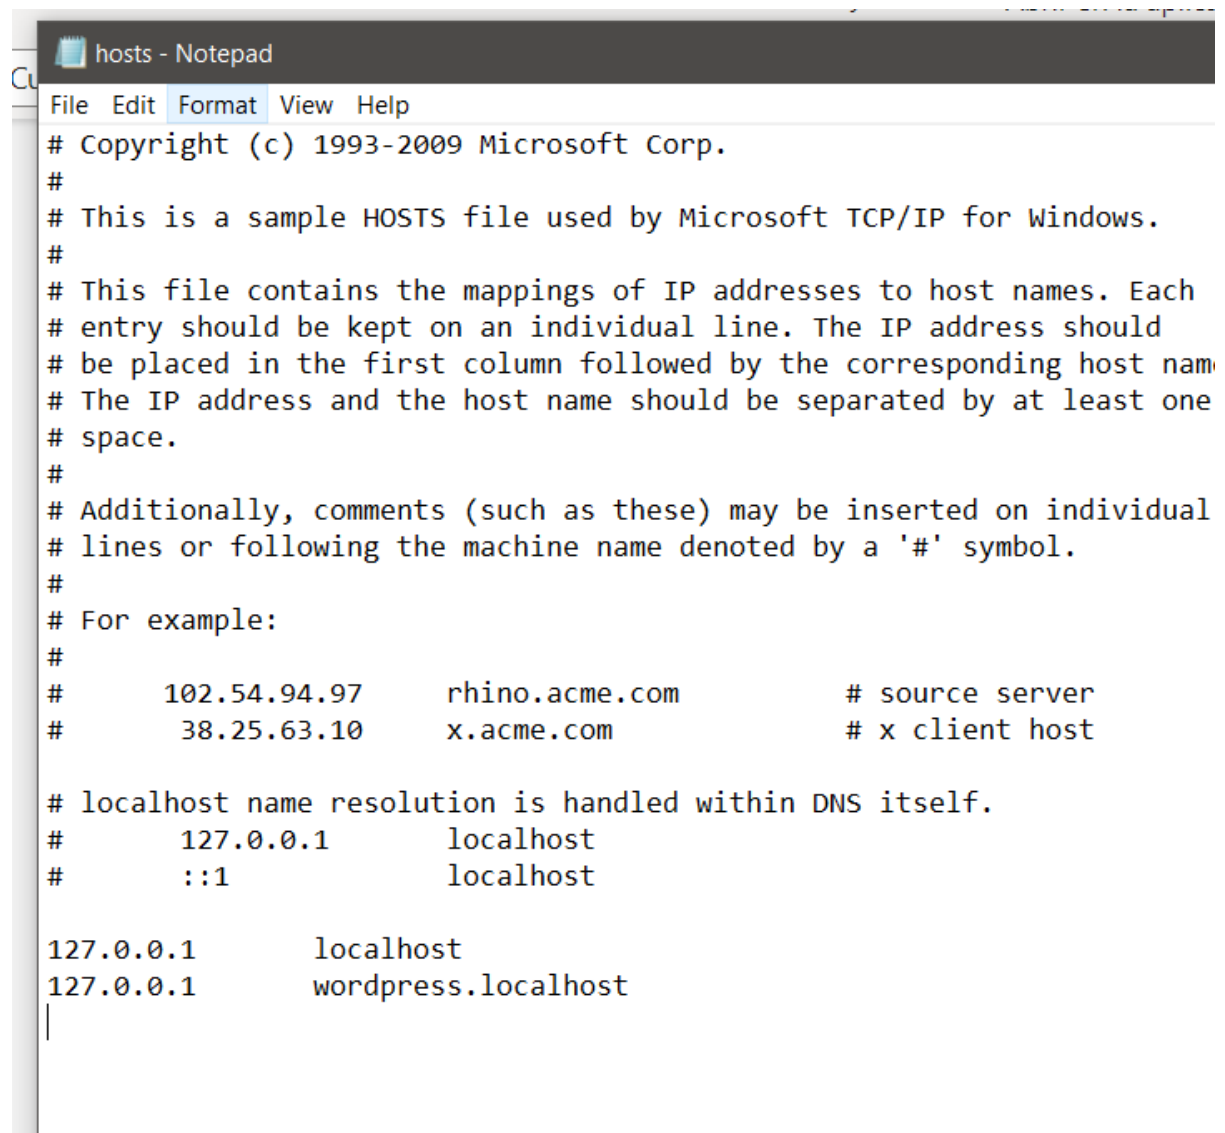

```
httpd-vhosts.conf - Notepad
File Edit Format View Help
# match a ##ServerName or ##ServerAlias in any <VirtualHost> block.
#

<VirtualHost *:80>
    DocumentRoot "C:/xampp/htdocs/"
    ServerName localhost
</VirtualHost>

<VirtualHost *:80>
    DocumentRoot "C:/xampp/apps/wordpress/htdocs"
    ServerName wordpress.localhost
</VirtualHost>

##<VirtualHost *:80>
    ##ServerAdmin webmaster@dummy-host.example.com
```

Ahora asignaremos el dominio personalizado a la dirección IP local en el archivo hosts de windows.

```
hosts - Notepad
File Edit Format View Help
# Copyright (c) 1993-2009 Microsoft Corp.
#
# This is a sample HOSTS file used by Microsoft TCP/IP for Windows.
#
# This file contains the mappings of IP addresses to host names. Each
# entry should be kept on an individual line. The IP address should
# be placed in the first column followed by the corresponding host name.
# The IP address and the host name should be separated by at least one
# space.
#
# Additionally, comments (such as these) may be inserted on individual
# lines or following the machine name denoted by a '#' symbol.
#
# For example:
#
#       102.54.94.97       rhino.acme.com          # source server
#       38.25.63.10       x.acme.com              # x client host

# localhost name resolution is handled within DNS itself.
#       127.0.0.1         localhost
#       ::1              localhost

127.0.0.1        localhost
127.0.0.1        wordpress.localhost
|
```

Ahora he encendido tambien el MySQL del xampp y al escribir <http://wordpress.localhost/>

Accedo sin problema a la página.
